ADR-003: Notification service for e-mail and SMS

Status: Accepted · Owner: Platform team · Date: 2026-09-28

Context

Several services need to tell customers about order and invoice updates.

Decision

A dedicated Notification service consumes OrderStatusChanged and InvoiceCreated events from RabbitMQ and sends e-mail and SMS through an external provider.

Data

Notification keeps its own notifications table with the delivery status of each message. It does not read any other service's database.

Messages

To keep payloads small, the events Notification consumes contain only the recipient and the message template data. We decided not to add correlation or tracing headers to these messages; delivery problems are investigated using the provider's dashboard.
